PUBLIC HEALTH STATISTICS OF OKLAHOMA
ACCIDENTAL DEATHS

1957

Accidents continued during 1957 to be the fourth leading cause of death in Oklahoma in the whole population and the first leading cause of death in all age groups from one through 34 years of age. For the first time since 1951, accidents accounted for a sufficient number of deaths to become, also, the leading cause in the 35-44 year age group. Causes which supercede accidents in number in the general population are diseases of the heart, cancer, and vascular lesions affecting the central nervous system. These causes are all ones which are associated with advanced age where death rates are highest. When the causes of death which affect younger age groups are studied, it is found that accidents lead all other causes at all ages from one through 34 years and that accidents cause more than half of all deaths of persons 15 through 24 years of age. The number of accidental deaths in each age group, as well as the per cent of total deaths, and the position of accidents as a cause of death may be seen in Table 1.

Table 1
Accidents as a Leading Cause of Death*
Oklahoma, 1957

*Based on deaths of residents of Oklahoma, regardless of place of accident.

The importance of accidents as a cause of death and the fact that a great many of them could be prevented have prompted the publication of this series of Part III, Accidental Deaths, Public Health Statistics, State of Oklahoma, of which this is the ninth edition. Source of data was certificates of death filed with the Oklahoma State Department of Health for deaths occurring in the State, and transcripts of certificates of death of Oklahoma residents dying in other states. Only limited information is reportable on death certificates giving the

circumstances associated with deaths from accidents. For motor-vehicle accidental deaths, the Department of Public Safety provided supplemental information obtained from motor-vehicle accident reports. These added to the completeness of detail of statistics concerning fatal motor-vehicle accidents.

Since this bulletin is concerned only with fatal accidents, the figures in it represent only a small proportion of the total accidents resulting in injury and loss of working time each year.

ALLOCATION TO PLACE OF OCCURRENCE

In this bulletin, with the exception of Table 1, all data are based on the place of occurrence of the accident rather than the place of residence of the deceased. For purposes of accident prevention and safety education, the place where the fatal injury was incurred is more meaningful than either the place of residence or the place of death.

POPULATION

Population figures used in computing rates for this publication have been estimated by the Division of Statistics. The estimate for the total population was 2,283,485; the white population, 2,071,014; the Negro population, 158,702; and the Indian, 53,769. Rates by race are shown on Table IV in the Appendix.

CLASSIFICATION OF ACCIDENT DATA

Two different classification schemes are used in studying accidental deaths. One of these is the National Safety Council Classification which provides for five major categories: occupational, home, motor-vehicle, public non-motor-vehicle, and unknown. Each of these categories is then subdivided by type of accident. Circumstances relating to the accidental deaths assigned to each of these five major categories are discussed in separate sections in this bulletin. The complete breakdown for this classification has been used in Tables I, II, and VII in the Appendix and the major categories in Tables IV and VIII. Chart I shows the accidental deaths for 1957 by these five groups. Another section of this bulletin is devoted to a discussion of "Age and Accidental Deaths," since age is an important factor to be considered in planning accident prevention programs.

The second classification is made according to rules of the International Statistical Classification of Diseases, Injuries and Causes of Death, "E" Code. This classification identifies the external cause of injury and has been used in Tables III, IV, VI, and VIII in the Appendix. A discussion of accidental deaths according to this classification appears in the following section.

Chart 1
Accidental Deaths by Major Classification,
Oklahoma, 1957

EXTERNAL CAUSE OF INJURY

During 1957, 1,507 deaths were assigned to accidents occurring in Oklahoma, an increase of 29 deaths over the number assigned during the previous year. The greatest number of these, 716, or 47.5 per cent, were attributed to motor-vehicle accidents, which are discussed in considerable detail in another section of this publication.

Falls ranked second as the means of external injury resulting in death. The 239 deaths assigned to this cause made up 15.9 per cent of the total accidental deaths. As in previous years, a very large proportion of the fatal falls were in persons of advanced age, with ages 65 years and over making up 83.3 per cent of the total. Falls from one level to another caused the fatal injury in 62 deaths, falls on the same level in 56 deaths, and falls of unspecified type in the other 121 deaths. Relative numbers of fatalities by cause of injury are shown in Chart 2.

In third place in numerical importance were the 103 deaths from burns and conflagrations, representing 6.8 per cent of the total. Of these, 93 were reported as being due to fire and explosion of combustible material and the remaining 10 as being due to hot substances, corrosive liquid, steam, or radiation. Twenty-three of the deaths in this category were in children under 5 years of age.

Chart 2
Accidental Deaths by External Cause of Injury,
Oklahoma, 1957

The number of accidental drowning deaths exceeded the number for any other year covered in this series of publications which began in 1949. The 102 deaths from drowning and submersion accounted for 6.8 per cent of the total. Seven additional deaths from water transportation accidents brought the number to 109, compared with the previous high number of 99 in 1951. A comparison of annual numbers of deaths from drowning and water transportation accidents is shown in Chart 3.

Chart 3

Accidental Deaths from Drowning, Including Water Transportation,
by Year, Oklahoma, 1948-1957

Firearms accidents took the lives of 57 persons, continuing an increase in number each year since 1954 in which the number of victims was 39.

Equal numbers of deaths, 28, were attributed to electric current, machinery, and poisoning by gases and vapors. Eighteen of the persons fatally injured by electric current and 25 of those fatally injured by machinery were at work when the accident occurred. These will be discussed in more detail in the section on occupational accidents.

Aircraft accidents claimed 26 lives during 1957. Of these, 8 were personnel in military aircraft, 2 were occupants of another specified type of plane, one was struck by the propeller of a plane on the ground, and 15 were persons in other and unspecified types of aircraft.

Twenty-five fatalities were reported from injuries by cataclysm, a term including tornado, flood, earthquake, and the like. Of these, 21 were due to tornadoes. Eight members of two families received fatal injuries in a tornado in Sequoyah County in January; 6 persons died in April of tornado injuries in Marshall, Carter, and Bryan counties; in May, 4 were fatally injured in Comanche County and one in Adair County; and in September, 2 died in Semnole County. Two additional deaths in the cataclysm group were attributed to flash floods.

Mechanical suffocation was reported responsible for the deaths of 21 persons of which 19 were infants under one year of age. Nineteen additional deaths were caused by inhalation or ingestion of food or other objects causing obstruction or suffocation. Eleven of these victims were under one year of age.

Other accident fatalities included 15 due to railway accidents, 20 to poisoning by solid or liquid substances, and 14 to blows from falling objects.

OCCUPATIONAL ACCIDENTS

By definitions of the National Safety Council, the occupational accident classification includes all deaths arising out of and in the course of gainful employment except when the injured person was a domestic servant or was involved in a transportation accident. Fatal accidents to domestic servants while at work are classified as home accidents, and fatal transportation accidents of persons while at work are classified as motor-vehicle or public non-motor-vehicle accidents. Information as to whether the deceased was at work when the injury occurred came from the death certificate, which requests this information on all deaths from external causes. Many certificates failed to supply this information and even when supplemental information was obtained, it frequently was not possible to determine whether or not the injured person was in the course of gainful employment. For this reason, these numbers of occupational accidental deaths may understate the true frequency of such deaths.

During 1957, 91 deaths were classified to occupational accidents, two more than in the previous year. Over one-fourth, 25, of these deaths were due to machinery accidents, 18 were due to electric current, and 13 to falls. Table 2 shows the numerically important causes of external injury for each of the principal occupational groups. As in previous years, machinery used in agriculture was

the means of external injury in the greatest number of deaths, 15. Four more deaths resulted from injury by machinery used in construction work, and 3 from injury by machinery being used in mining, quarrying or in oil and gas well activity. Also, as in previous years, the largest number of occupational fatalities occurred to persons engaged in agriculture. In addition to the accidents due to machinery, 4 deaths were attributed to blows from falling objects, 3 to electric current, and 3 to firearms.

Table 2
Occupational Accidental Deaths, by Occupation,
by External Cause of Injury, Oklahoma, 1957

External Cause of Injury	Total	Occupation					
		Agri- culture	Service	Mining, etc.	Manufac- turing	Construc- tion	Public Utility Other
Total	91	29	19	17	2	13	3
Machinery	25	15	1	3	-	4	2
Electric current	18	3	4	5	1	2	1
Falls	13	-	6	1	-	5	1
Falling object	11	4	-	4	1	2	-
Fire	7	-	1	4	-	-	2
Firearms	7	3	4	-	-	-	-
All others	10	4	3	-	-	-	3

Nineteen accident victims were engaged in service occupations when the injury occurred. Six of these were due to falls, 4 each to electric current and firearms, and one each to machinery and fire.

Occupations connected with mining, quarrying, and oil and gas well activities were those being followed by 17 accident victims. Electric current was responsible for the injury in 5 deaths, falling objects and fire for 4 deaths each, machinery for 3 deaths, and falls for one death.

Thirteen deaths occurred in connection with construction work, with falls causing 5 deaths, machinery causing 4 deaths, and electric current and falling objects causing 2 deaths each.

HOME ACCIDENTS

The home accident classification includes all deaths resulting from accidents occurring in homes, on home premises, or in resident institutions. Also included are injuries to domestic servants. Deaths of other persons in the course of gainful employment, however, are classified to occupational accidents even though the injury may have occurred on home premises.

During 1957, 331 deaths were classified as being due to home accidents. This is a smaller number than that for the previous year when 359 were so classified.

These 331 deaths represented 22.0 per cent of all accidental deaths. Next to motor-vehicle accidents, home accidents accounted for more deaths than any other of the major categories of the National Safety Council Classification. The age groups most susceptible to fatal home accidents were the very young and the very old age groups. Children under 5, with 66 deaths, and the age group 65 and over, with 175 deaths, represented 72.8 per cent of the home total.

Chart 4
Home Accidents by External Cause of Injury,
Oklahoma, 1957

Chart 4 shows the fatal home accidents by type; additional information about these deaths is shown in the tables in the Appendix. The largest number of home fatalities was attributed to falls, with 43.0 per cent of the deaths in this category specified as due to that type of accident. As might be expected, the majority of the persons dying as the result of injuries received in falls were in the older age groups; 89.4 per cent were 65 years of age or older.

The next largest group of fatal home accidents was due to fires or explosion of combustible material, accounting for 7.6, or 23.0 per cent, of the deaths from home accidents. Twenty victims were under 5 years of age and 31 were 65 years old or older, together making 67.1 per cent of the total from these causes. An additional 4 deaths were attributed to hot substance, corrosive liquid or steam.

A total of 28 deaths from home accidents was attributed to poisonings; 9 of these were from solid or liquid poisons and 19 were from poisonous gases or vapors. Five of the 9 deaths from the former group were children under 5 years old. The poisoning agents in these 9 deaths were: drugs, 4 deaths; petroleum products, 2 deaths; industrial solvents, 1 death; and arsenic compounds, 2 deaths. Of the 19 deaths from poisonous gases or vapors, 11 were attributed to utility

gas, one to motor-vehicle exhaust gas, and the remaining 7 to other carbon-monoxide gases. Thirteen of these 19 deaths occurred during the cold-weather months--January, February, October, November, and December.

Accidents involving firearms were responsible for 26 deaths, a number equal to the corresponding number for the previous year. Ten of these 26 victims were children 5-14 years of age.

Nineteen deaths were attributed to mechanical suffocation of which 18 were infants under one year of age.

MOTOR-VEHICLE ACCIDENTS

All deaths resulting from motor-vehicle accidents were assigned to this category regardless of whether the decedents were using the vehicles in carrying out duties related to their occupation or not. Therefore, this category includes both traffic and non-traffic accidents. For this reason, and for reason of other minor differences in classification systems, these data will not agree with those published by the Department of Public Safety. Of the 716 fatalities attributed to motor-vehicle accidents occurring in 1957, 23 were classified as non-traffic and 693 were classified as traffic accidents. Supplemental information received routinely from the Department of Public Safety on each death resulting from a motor-vehicle accident has made it possible for more detailed data relating to this type of accident to be tabulated. Tables I, II, and V give information about these accidental deaths.

The 716 motor-vehicle accident deaths during 1957 represent an increase of 21 deaths over the number in 1956. A large proportion, 48.9 per cent, of these fatal accidents were collisions between two or more motor vehicles. The next largest group, 18.0 per cent, were accidents classified as non-collision, which included overturning on roadway, running off the roadway, and the like. Eighty-one, or 11.3 per cent, of those who died were involved in accidents with pedestrians, and another 92 victims were in accidents involving collision with fixed objects.

PUBLIC NON-MOTOR-VEHICLE ACCIDENTS

This category includes deaths resulting from accidents other than motor-vehicle which occurred in the public use of any premises. There were 291 deaths assigned to this classification in 1957, compared with 209 in 1956 and 181 in 1955. Public non-motor-vehicle transportation accidents accounted for 54 deaths. Fifteen of these were due to railroad accidents, 7 to water transportation accidents, 26 to air transportation accidents, and 6 to accidents of other vehicles.

The remaining 237 deaths resulted from other accidents occurring in public places. Drowning was responsible for 89 of these deaths, falls for 63, firearms for 16, fire and explosion of combustible material for 8, and other accidents for 61.

PLACE OF ACCIDENT UNKNOWN

The "unknown" category, as used by the National Safety Council, includes all accidental deaths for which the kind of place where the accident occurred was not reported. Also included are all deaths due to the late effects of accidental injury.

Of the total of 78 deaths falling in this category, 21 were attributed to falls, 11 to late effects of accidental injury, 8 to poisoning, 8 to firearms, and 6 to drowning. A breakdown of the fatalities according to external cause of injury, by race, is shown in Table 3.

Table 3

AGE AND ACCIDENTAL DEATHS

The frequency with which certain types of accidents occur varies for different age groups, depending to a large extent upon the customary activities of the individuals in the age groups and their ability or inability to cope with the hazards they encounter.

Chart 5

Leading Causes of Accidental Death (Motor-vehicle Accidents Excluded) for Selected Age Groups, Annual Average, Oklahoma, 1955-1957

Drownings led other of these accidental causes for age groups 5-14 years and 15-24 years. In the younger of these spans, burns and firearms were in second and third places, respectively. At ages 15-24 years, this order was reversed and firearms injuries were in second place with burns being third. Falls and machinery injuries were in next order for those 5-14 years old while aircraft accidents and poisonings were in fourth and fifth places for those 15-24 years of age.

Burns led other accidental injuries at ages 25-34 years, followed closely by aircraft injuries. Drownings ranked third followed by firearms injuries and poisonings which were equal in number. Drownings, burns, and firearms injuries appeared in all four age groups among the five leading causes of accidental death.

Chart 5 shows, as an average for the years 1955-1957, the numerically important causes of fatal injury in four age groups covering ages 1-34 years. Motor-vehicle fatalities, which rank first in this entire age span, have been excluded.

At ages 1-4 years, fatal injuries resulting from burns and conflagrations led all other types of injury in number, motor-vehicle accidental injuries excluded. Next were drownings, then poisonings, followed by suffocation and then by firearms injuries.
